What's New In AntBuilder?

AntBuilder is a command-line based solution that you can use to build and package your Java application without the use of an IDE or other build tool. AntBuilder is designed to provide you with the same functionality and flexibility that a development IDE provides with your Java development process. AntBuilder Features: Convenience You can now build and package your Java application with AntBuilder, with nothing more than the addition of a build.xml or build.bat file in your project directory, and the use of AntBuilder. Platform Independent AntBuilder can work on any platform that has a JRE installed. It is platform independent, it doesn't care about the operating system where your Java application is developed. Flexible and Simple AntBuilder was designed to provide you with all the basic building and packaging processes that you would expect from a full-fledged IDE. AntBuilder is simple, but powerful. It is a task-based, tree-structured building tool that allows you to build any Java application with the use of a few simple tools. Simple and Fast Simple, fast and easy to use, AntBuilder is a command-line based building tool. But more than just this, it allows you to build J2EE applications that can be deployed onto a J2EE container. It is also designed to be robust, and supports dynamic configuration and variables. Assembling your project, building and packaging your application can now be done with the few clicks of your mouse. Using AntBuilder is as simple as opening the AntBuilder menu and selecting the desired option. Installation: You can download AntBuilder from its home page here Download the ZIP archive and unzip it to a directory where you have write access. At the end of the antBuilder installation process, you should have a folder named antBuilder. You can rename it to anything you like. Open a command prompt window and cd to the antBuilder folder. Now you can run antBuilder by opening a command prompt window and typing antBuilder. If you want to run antBuilder from an IDE, open its configuration file, by right-clicking the Project Explorer and choosing Properties, and navigate to the Run Configuration dialog. There you should select the Command tab and type antBuilder. Usage From the moment you run antBuilder, you can start creating your Java project. Just choose the directory where
